Disclaimer: The OOCL Carbon Calculator is based on certain assumptions, the information input in this tool, and OOCL's vessel fleet carbon dioxide equivalent (CO₂e) emissions data, using Clean Cargo Methods. The door emission figure uses the average distance from center of the city. The processes of data collection, research methodology and emission calculation methodology have been verified by LRQA. The options of Tank-to-Wake (TTW) and Well-to-Wake (WTW) CO₂e emissions are available in this tool, assuming 100% vessel capacity utilisation. A default utilisation rate is used for inland transport. The calculations generated by the OOCL Carbon Calculator should be used at your own discretion and OOCL shall not be responsible for its results or accuracy. If you have found any irregularities or have doubts about the calculations, please kindly contact us at CO2ENQ@OOCL.COM. Thank you.
